

Wistudi x EduSpaze

Commercial Partnership & Integration Model

Partnership Proposal | September 2026

Purpose

To outline a flexible framework through which Wistudi, EduSpaze and selected EdTech partners can validate technical integration, define appropriate access models and develop commercial pathways over time.

A simple principle underpins the model:

Technical integration depth and commercial depth are separate decisions.

1. Executive Summary

Wistudi proposes a flexible partnership framework for EduSpaze and selected EdTech partners, with the goal of validating Wistudi as an interoperable publishing and learning ecosystem where third-party tools can operate as Partner Blocks within Flows and XP Videos.

Technical integration and commercial structure are treated separately. Partners can begin with a simple pilot and later progress to authenticated access, LTI 1.3, Deep Linking, grade passback or API-based workflows without automatically changing the commercial model.

During the initial validation phase, partners can retain their own pricing, subscriptions and customer relationships, with no commission or referral fee in either direction. Deeper models such as licensing, co-selling, bundled offers and strategic partnerships can be explored after technical and market validation.

Recommended starting point

Assess 3-5 suitable partner candidates, select 2-3 for practical integration pilots, keep commercial models independent during validation, and decide on deeper commercial structures only after technical and market fit are clearer.

How to read this framework

1	Choose the technical integration level	How deeply should the product connect with Wistudi?
2	Choose the commercial model	How should the combined proposition be accessed, sold or licensed?
3	Define access presentation	What should users see before adding or opening the Partner Block?
4	Set support and cost ownership	Who handles product support, integration support and implementation costs?

2. Proposed Role for EduSpaze

EduSpaze's proposed role is to support ecosystem access and validation by helping identify suitable EdTech companies from its portfolio or wider network, facilitating relevant introductions, and supporting early partnership discussions where appropriate.

Technical implementation and product support remain the responsibility of Wistudi and the relevant EdTech partner unless otherwise agreed. The objective is to use EduSpaze's network to identify a small number of high-fit opportunities and validate the Wistudi partner ecosystem in a focused way.

3. Core Partnership Principles

Principle	What it means
Start low-friction	Partners are not required to change their existing pricing, customer model or product structure simply to test integration with Wistudi.
Separate technical depth from commercial depth	An LTI or API integration does not automatically require revenue sharing. Commercial terms depend on customer ownership, distribution responsibility, licensing and strategic value.
Protect the user experience	Wistudi must clearly distinguish between Partner Blocks that are included, organisation-licensed, bundled, or require a separate third-party subscription.
Each party supports its own product	Wistudi supports the Wistudi environment and integration layer. The partner supports the partner product unless a deeper support agreement is made.
Move from validation to commercialisation	The first stage should validate ecosystem fit. Deeper monetisation should follow once usage, demand and operational responsibilities are clearer.

4. Technical Integration Levels

The technical level answers one question: how deeply does the partner product connect with Wistudi? This is assessed separately from commercial terms.

Level	Integration	Description	Best use
1	Simple Embed / Pilot	Partner content or activity is embedded inside a Wistudi Flow or XP Video where technically permitted.	Fast validation of user experience; limited data exchange.
2	Authenticated Partner Block	Users authenticate or connect their partner account from inside Wistudi.	Useful where access depends on the user's existing partner subscription.
3	Connected Access & Results	Trusted launch, optional completion status, score or result information returned to Wistudi.	Useful where the partner activity contributes to the learning journey or reporting.
4	Content Workflow Integration	Creators can select, create or edit partner content from inside Wistudi instead of copying URLs manually.	Improves authoring workflow and makes partner content easier to use inside Flows.
5	Advanced / LTI 1.3 / API / Custom	LTI launch, Deep Linking, grade passback, extended data sharing, APIs, webhooks or custom institutional workflows.	Best for strategic, scalable or institution-level integrations.

Important

Moving from Level 1 to Level 5 does not automatically change the commercial model. A technically advanced integration can still operate under the Independent Commercial Model if that is the right commercial arrangement.

5. Commercial Models

The commercial model answers a different question: how do Wistudi, the partner and the end customer pay for or access the combined proposition? These models can be combined with different technical integration levels.

Model	Commercial meaning	Typical use
1. Independent	Each party keeps its own pricing, subscriptions, users and revenue. No commission either way.	Initial pilots, simple embeds, authenticated Partner Blocks and early LTI tests.
2. Mutual Licensing	Either Wistudi licenses partner access for eligible users, or the partner licenses Wistudi organisation or multi-organisation access for its customers.	When one platform wants to include the other's capability within its own customer offer.
3. Co-Selling	Wistudi and the partner jointly sell an integrated proposition, usually retaining separate contracts and invoicing.	Joint demos, pilots and sales activity, including agreed promotional or bundled rates.
4. Bundled / Reseller	One party commercially packages or resells the other party's product under agreed wholesale, reseller or bundled terms.	When one party will sell the combined offer or resell the other product to its own customers.
5. Strategic Ecosystem	Custom arrangement combining deep integration, licensing, support, distribution, data, marketing and commercial commitments.	Large-scale institutional partnerships, regional expansion or strategic product alignment.

5.1 Model 1: Independent Commercial Model

This model is proposed as the initial commercial structure for selected EduSpaze introductions. The Partner Block can be added directly into a Wistudi Flow or XP Video while the partner retains its own pricing, subscription and entitlement model.

When the user opens the block, they authenticate either within the block where supported, or through the partner's platform. Their level of access is then determined by their existing account or subscription with that partner.

Wistudi continues to earn through its own publishing, credits and platform model, while the partner retains its own commercial revenue. No referral, commission or revenue share applies at this stage.

Why this works for validation

It keeps the initial barrier low while allowing all parties to validate the integration before considering deeper commercial arrangements.

5.2 Model 2: Mutual Licensing

Licensing can operate in either direction. Wistudi may purchase licences, usage rights or organisation access from the partner and make that Partner Block available to eligible Wistudi users without requiring a separate purchase.

The reverse may also apply. A partner may license Wistudi for its own customers, typically through an organisation-level or multi-organisation agreement with an agreed credit allocation and access period rather than a per-user model. Larger partnerships may also use a custom platform or embedded licence.

Wistudi's standard platform model uses publishing credits. For some institutional or partner agreements, a more predictable structure - such as per-learner, per-organisation, site licensing or a wholesale licence - may be commercially more practical. In those cases, the agreed commercial structure may replace or sit alongside the standard credit model for that specific arrangement.

5.3 Model 3: Co-Selling

Co-selling means Wistudi and the partner intentionally go to market together with an integrated proposition. This can include joint demos, workshops, webinars, institutional introductions, pilot proposals and coordinated sales activity.

The parties normally retain their own contracts, invoicing and product responsibilities. However, they may agree promotional or bundled pricing so customers receive a preferred rate when purchasing both solutions together.

Revenue sharing is not required for co-selling. The commercial benefit is joint market access and a stronger combined proposition while each party continues to sell its own product.

5.4 Model 4: Bundled / Reseller Distribution

This model applies when one party commercially packages or resells the other party's product. For example, a partner may purchase Wistudi organisation or multi-organisation access at an agreed wholesale or partner rate and resell it to its own customers at its own commercial price, subject to agreed reseller terms. The reverse arrangement may also apply.

Unlike co-selling, the reseller or bundling party may own the primary customer contract and invoice for the combined offer. Wholesale pricing, reseller margin, support responsibilities, renewals and any minimum commitments should therefore be agreed in advance.

5.5 Model 5: Strategic Ecosystem Partnership

This is a bespoke model for deeper partnerships. It may combine advanced technical integration, licensing, co-selling, distribution, support SLAs, joint product development, data exchange and market expansion.

This model is intended for relationships with strong strategic alignment, material institutional opportunity or clear potential to expand the Wistudi ecosystem proposition.

6. Partner Block Access and User Presentation

Partner Block access will be presented transparently within Wistudi. Blocks may require an external partner subscription, be included through Wistudi or organisation licensing, or form part of a bundled commercial agreement.

Access status	Meaning	Suggested CTA	Placement guidance
Available Now / Included	Wistudi or the user's organisation has entitlement to the partner block.	Add Block	Prominent placement; low-friction user experience.
Included in Organisation Plan	The school or organisation has purchased a bundle or licence that includes the partner block.	Add Block	Highlighted for eligible organisation users.
Connect Existing Account	The user has or may have a partner account/subscription managed directly by the partner.	Connect Account	Clearly label before use. Do not imply Wistudi includes access.
Partner Subscription Required	The user must purchase or activate access directly with the partner.	Learn More / Connect Account	Avoid misleading users. Make this visible on the block card before adding.
Premium Add-on	Access can be purchased as a Wistudi-managed add-on or credit-based partner capability.	Request Access / Upgrade	Useful later once Wistudi offers marketplace or add-on commercial flows.

Partner Block presentation principle

Blocks requiring an independent third-party subscription will be clearly identified before use. Licensed, bundled or organisation-entitled blocks may be presented as directly available to eligible Wistudi users.

7. Integration Fees, Technical Support and Cost Allocation

Technical integration fees are treated separately from the commercial model. Any applicable fees depend on integration scope, complexity, strategic value and the implementation responsibilities of each party.

During the initial EduSpaze ecosystem validation phase, Wistudi may waive or subsidise technical integration fees for selected launch partners. This enables both parties to validate technical compatibility and the wider ecosystem model before moving into a standard commercial integration arrangement.

Integration scope	Fee approach	What the fee/support covers
Basic Embed / Pilot	Usually free or waived for selected partners	Validation, configuration guidance and limited testing.
Authenticated Partner Block	May be free, subsidised or low setup fee	Authentication flow, entitlement testing and launch behaviour.
Connected Results / Data	Setup fee may apply	Testing completion, score return, callbacks and reporting behaviour.
LTI 1.3 / Deep Linking / AGS	Implementation fee likely applies unless strategic waiver is agreed	Technical setup, security review, sandbox testing and interoperability QA.
Custom API / Strategic Integration	Scoped quotation or included in strategic commercial agreement	Custom engineering, maintenance obligations and possible SLA.

8. Support and Operational Responsibilities

Issue type	Primary responsibility	Examples
Wistudi platform issue	Wistudi	Flow publishing, Wistudi login, credits, reports, builder/player issues.
Partner product issue	Partner	Partner activity errors, partner content, partner account/subscription access, partner-specific functionality.
Integration issue	Joint escalation	Launch failure, authentication mismatch, LTI configuration, result return failure.
Customer onboarding	Depends on commercial model	Separate onboarding for independent model; coordinated onboarding for co-selling, bundled or strategic models.
Learner data and privacy	Jointly defined per integration	Data fields, retention, security, controller/processor roles and permitted usage.

For deeper commercial arrangements, Wistudi and the partner may agree on enhanced support, named technical contacts, response expectations, sandbox access, implementation documentation, training or service-level commitments.

9. Proposed EduSpaze Ecosystem Validation Programme

Wistudi proposes beginning with a focused ecosystem validation programme. EduSpaze can support the identification of a small group of suitable EdTech companies from its portfolio or wider network, after which Wistudi and each partner can assess technical fit, product fit and the most appropriate commercial pathway.

Step	Stage	Output
1	Partner identification	EduSpaze introduces suitable partners whose products could add value inside Wistudi Flows or XP Videos.
2	Technical assessment	Assess embed support, authentication, LTI readiness, Deep Linking, result return, APIs and data requirements.
3	Commercial access classification	Classify each Partner Block as external subscription required, included, organisation-licensed, bundled or premium add-on.
4	Pilot integration	Implement selected test integrations and validate learner/creator experience.
5	Go-to-market review	Decide whether to continue as independent access, mutual licensing, co-selling, bundled distribution or strategic partnership.

Validation phase commercial position

No commission or referral fee would apply in either direction; selected technical integration support may be waived or subsidised by Wistudi; and each party would retain its own commercial model unless a specific licensing or bundle arrangement is agreed.

10. Partner Assessment Summary

Before implementation, each prospective partner should be reviewed at a high level across four areas:

- Product fit - the partner capability should add clear value inside a Wistudi Flow or XP Video.
- Technical feasibility - an appropriate integration path should be available, from embed or authenticated access through to LTI, Deep Linking or API where required.
- Access and entitlement - it should be clear whether access is included, organisation-licensed, bundled or requires a separate partner subscription.
- Delivery readiness - support ownership, data requirements and continuity expectations should be understood before production use.

A detailed partner qualification and pilot process is set out separately in the Wistudi Partner Qualification & Pilot Framework.

11. Continuity and Termination

Because Partner Blocks may sit inside active published learning experiences, production agreements should define notice, replacement or archive guidance, and any appropriate continuity period if an integration ends.

Decision sequence

Technical level -> Commercial model -> Access presentation -> Support/cost ownership -> Pilot -> Go-to-market review
